

A More Rational Ranking System in Olympic Games

Yadolah Dodge and Giuseppe Melfi

Statistics Group, University of Neuchâtel, Switzerland

Abstract: We analyze the final results of the 2002 Salt Lake City and the 1998 Nagano Winter Olympic Games as well as the 2000 Sydney Summer Olympic Games. Instead of ranking countries by total number of winning medals, we propose a new ranking by standardizing a weighted sum of the number of medals by population size.

Key Words: Olympic data, ranking.

1 Introduction

The 2002 Salt Lake City Winter Olympic Games are now closed in the USA, and, despite of de Coubertin's maxime 'The important thing is to participate', all newspapers in the whole planet exhibited only ranking of nations with the count of gold, silver and bronze medals, and celebrated as modern heroes, their athletes. The final olympic table ranks nations by either the total number of medals obtained, or only by the number of gold medals first, then silver and bronze, or by giving a unique score with special weights to gold, silver and bronze.

The aim of this note is an attempt to present a more rational ranking system. We see that if we slightly modify the ranking criteria, small nations in population size will have a better ranking as compare to the actual system.

2 Current ranking

There are basically three ways of ranking the winning nations in any Olympic games. The first one consists of using a criterion for ranking nations in Olympic games is the lexicographic order of medals. Nation A is better placed than B if A has more gold medals than B . When A and B have the same number of gold medals, A is better

placed than B if A has more silver medals, and so on. This is the most common method of ranking nations in the final table. The media often use this method of ranking. In this method a nation with a unique gold medal is ranked better than a nation with an arbitrarily large number of silver and bronze medals.

A second method, consists of ranking nations by total number of winning medals. The official web site of the Salt Lake City Olympic Games [3] employs this method. The problem with this way of ranking is that a nation may have 20 bronze medals and gets a better ranking than a nation with 19 gold medals.

A third method of ranking the winning nations which is more rational and takes into account the drawbacks of the above two methods can be described as follows. Let P be defined as

$$P = 3 \times (\text{No. of gold medals}) + 2 \times (\text{No. of silver medals}) + \text{No. of bronze medals}.$$

The ranking of nations is determined by decreasing values of the score P . This method is used for example in [2], where is applied to produce a ranking for each edition of Olympic games. Table 1 and 2 respectively show the ranking of nations for the Nagano 1998 and Salt Lake City 2002 Winter Olympic Games using the third methods, according to the score P .

	Nation	Gold	Silver	Bronze	Total	P
1	Germany	12	9	8	29	62
2	Norway	10	10	5	25	55
3	Russia	9	6	3	18	42
4	Canada	6	5	4	15	32
5	USA	6	3	4	13	28
5	Austria	3	5	9	17	28
7	Netherlands	5	4	2	11	25
8	Japan	5	1	4	10	21
9	Italy	2	6	2	10	20
9	Finland	2	4	6	12	20
11	China	0	6	2	8	14
12	South Korea	3	1	2	6	13
12	Switzerland	2	2	3	7	13
12	France	2	1	5	8	13
15	Czech Republic	1	1	1	3	6
16	Sweden	0	2	1	3	5
17	Bulgaria	1	0	0	1	3
18	Ukraine	0	1	0	1	2
18	Denmark	0	1	0	1	2
18	Belarus	0	0	2	2	2
18	Kazakhstan	0	0	2	2	2
22	United Kingdom	0	0	1	1	1
22	Belgium	0	0	1	1	1
22	Australia	0	0	1	1	1

Table 1. Ranking of winning nations according to the score P . Nagano 1998.

To compare the three methods described above, take Austria as an example. For the Salt Lake City Winter Olympic Games, with the method one, sorting by gold medals first, Austria is ranked in the 12th position, while with the second method, ranking by total number of medals, it is ranked in the 5th position and with the third method, according to the P score, it is ranked in the 6th position.

The third method which is based on the P score has also a drawback. Take for example the Nagano Winter Olympic Games. From Table 1 we see that if we use the P score, China with no gold medal gets better ranking than France with two gold

medals. This happens because the number of silver medals of China are superior than that of France. Hence, China is in 11th place, and France is in the 12th place .

	Nation	Gold	Silver	Bronze	Total	P
1	Germany	12	16	7	35	75
2	USA	10	13	11	34	67
3	Norway	11	7	6	24	53
4	Russia	6	6	4	16	34
5	Canada	6	3	8	17	32
6	Austria	2	4	10	16	24
6	Italy	4	4	4	12	24
6	France	4	5	2	11	24
9	Switzerland	3	2	6	11	19
9	Netherlands	3	5	0	8	19
11	Finland	4	2	1	7	17
12	China	2	2	4	8	14
13	Croatia	3	1	0	4	11
14	South Korea	2	2	0	4	10
15	Sweden	0	2	4	6	8
16	Estonia	1	1	1	3	6
16	Australia	2	0	0	2	6
16	Spain	2	0	0	2	6
19	United Kingdom	1	0	2	3	5
20	Bulgaria	0	1	2	3	4
20	Czech Republic	1	0	1	2	4
22	Japan	0	1	1	2	3
22	Poland	0	1	1	2	3
24	Belarus	0	0	1	1	1
24	Slovenia	0	0	1	1	1

Table 2. Ranking of winning nations according to the score P . Salt Lake City 2002.

Now suppose, in addition to the weights furnished by the third method, we add another element of importance, the population size of a winning nation, into consideration. If a country of a small size, for example 7 or 11 millions, win a bronze medal, it should be ranked better than a country with say 350 millions with the same bronze medal. We think it is more rational to bring the population size into account in ranking the nations for the final olympic results. This new weight, the population size, is an attempt to make a new adjustment for ranking nations.

3 Ranking: A proposition

Let Q be defined as $Q = P \cdot 10^6 / \text{Population}$. Here we considered the data of populations for 1998 one can find in [1] . Table 3 shows the Nagano 1998 and Salt Lake City Winter Olympic Games ranking according to the Q score.

The result of this scoring shows that highest positions are occupied by countries of a medium size where winter sports are very popular. Moreover, as we all know, the winter sports are rather expensive and not all nations, specially the southern nations, can participate in such events.

The same idea can be applied to the Summer Olympic Games. For example, we can apply the Q score method to the Sydney 2000 Summer Olympic Games where more countries participated.

Nagano1998				Salt Lake City 2002			
Rank	Nation	Pop.(10 ⁶)	Q	Rank	Nation	Pop.(10 ⁶)	Q
1	Norway	4.42	12.4434	1	Norway	4.42	11.9910
2	Finland	5.15	3.8835	2	Estonia	1.42	4.2254

74	Sri Lanka	0	0	1	1	1	18.93	0.0528
75	Kuwait	0	0	1	1	1	1.91	0.5236
76	Israel	0	0	1	1	1	5.64	0.1773
77	Iceland	0	0	1	1	1	0.27	3.7037
78	India	0	0	1	1	1	983.38	0.0010
79	Chile	0	0	1	1	1	14.68	0.0681

Table 4. Data of Summer Olympic Games, Sydney 2000.

The results of the Table 5 show an unexpected homogeneity. In best positions we have several Caribbean countries, as well as the host country, Australia. European countries of different sizes get lower ranking. Except for Russia, large countries such as USA, China, Japan, Brazil, have a modest ranking, and they have a ranking comparable to that of most emergent countries.

The ranking proposed in this paper according to Q score method standardizes the number of medals by population size. The score Q can be considered as a measure of the popularity of certain disciplines, namely Olympic sports. Of course, one can combine many other socio-economic and geographic factors, the number of participating athletes for each nation, and so on to come up with a more accurate and optimal measure of ranking. A nice problem!

Rank	Nation	Q	Rank	Nation	Q
1	Bahamas	17.8571	41	USA	0.7362
2	Australia	6.1795	42	Belgium	0.6876
3	Cuba	5.6159	43	Moldova	0.6726
4	Norway	4.7511	44	Uruguay	0.6079
5	Jamaica	4.1667	45	Costa Rica	0.5540
6	Barbados	3.8462	46	Ireland	0.5525
7	Iceland	3.7037	47	Serbia and Montenegro	0.5352
8	Netherlands	3.6872	48	Kuwait	0.5236
