Computational Linguistics, 19(1), 1993, 143-177.

J. Savoy: *Lexical Analysis of US Political Speeches*. Journal of
Quatitative Linguistics, to appear

Discriminating Features

- Various methods have been proposed to define / weight the importance of each word / term in describing the semantic content of a document
- Usually related to Information Retrieval (IR)
- Here we will focus on a *comparative* basis
- How can we characterize a corpus (or a document or a set of documents) in comparison with another?
Compare two works of two different authors
Compare two works of the same author
Compare a web site with another

Discriminating Features

- To define whether a given feature (e.g., word, bigram, POS, etc.) is used significantly more often in a given corpus, we may subdivide the whole corpus (C) into two (or more) disjoint parts
- Example: US electoral speeches

Our US Corpus

US: all speeches given by B. Obama & J. McCain during the years 2007 & 2008

Example with 15 tokens and 4 types

Contingency Table

- We can resume all needed information into a contingency table (one per word / feature)
- A large corpus **C** is subdivided into two (disjoint) parts **S** and **C-** (with $\mathbf{C} = \mathbf{S} \cup \mathbf{C-}$)

	S	C-	
ω	a	b	$a + b$
not ω	c	d	$c + d$
	$a + c$	$b + d$	$n = a + b + c + d$

Bernoulli Process

- Example

The word “IT” in Obama’s speeches in 2008 (**S**) vs. all other US electoral Speeches (**C-**)

	Obama’08	C-	
“IT”	1	0	1
not “IT”	294,552	334,541	629,093
	294,553	334,541	629,094

- $\text{Prob}[\omega] = \text{Prob}[\text{“IT” in C}] = (a+b)/n = 1/629,024 = 0.0000016.$

- $n' = a + c = 294,553$

Bernoulli Process

- We can view the distribution of ω as follows.
- We draw a (biased) coin (Bernoulli process).
For each “head” (success) we generate the word ω .
For each “tail” (failure), another word.
- The probability of obtaining “head” is small
(e.g., $\text{Prob}[\omega] = 0.0000016$).
- We repeat this process n' times (e.g., $n' = 294,553$)
- We may expect finding $n' \cdot \text{Prob}[\omega]$ heads (or successes or word ω in a document composed of 294,553 word tokens)
In our example, we obtain 0.468.
This value is the mean of the underlying Bernoulli process⁷

Bernoulli Process

- Another example
- We draw a (biased) coin.
The probability of obtaining “head” (success) is $p = 0.4$
The probability of “tail” (failure), $1 - p = 0.6$.
- We repeat this process n' times ($n' = 10$)
- We may expect finding $n' \cdot p$ heads.
In our example, we have $10 \cdot 0.4 = 4$.

Bernoulli Process

- We can then compare the expected number of occurrence ($n' \cdot \text{Prob}[\omega]$) of the word ω with a (the observed number of occurrence).
- In our case, we obtain 0.468 and $a = 1$.
- The difference must be analyzed with respect to the underlying (normal) variability. This is measured by the standard deviation (denoted σ) defined as:

$$\sigma = \sqrt{n' \cdot \text{Prob}[\omega] \cdot (1 - \text{Prob}[\omega])}$$

If σ is large, we may expect a larger (but normal) difference between ($n' \cdot \text{Prob}[\omega]$) and a

The Z Score

- As a general measure to take account for the difference between:
 - an observed value (x), a random variable
 - its mean (μ)
 - its standard deviation (σ) (or its variance σ^2)

we may compute its Z score (standardized score) as

$$Z \text{ score} = \frac{x - \mu}{\sigma} = \frac{x - \mu}{\sqrt{\sigma^2}}$$

on our case,

$$Z \text{ score} = \frac{x - \mu}{\sigma} = \frac{a - (n' \cdot Prob[\omega])}{\sqrt{n' \cdot Prob[\omega] \cdot (1 - Prob[\omega])}}^{10}$$

The Z Score

- In our example (word “IT”), we have

$$Z \text{ score} = \frac{1 - (294,553 \cdot 1/629,094)}{\sqrt{294,553 \cdot 1/629,094 \cdot (1 - 1/629,094)}} = 0.777$$

is this value significantly large?

- To have a complete answer, we need to compare it with “normal” values. Is this possible? Yes, because it is known that the Z score follows a Normal distribution $N(\mu=0, \sigma^2=1)$ or in short, $N(0,1)$.

The Z Score

The interesting values of a $N(0,1)$ distribution are ...

Probability	Z value
0.01	-2.33
0.025	-1.96
0.05	-1.64
0.1	-1.28
0.5	0.0
0.9	1.28
0.95	1.64
0.975	1.96
0.99	2.33

Characteristics Terms

- Back to our example

The word “IT” in Obama’s speeches in 2008 (**S**) vs. all other US electoral Speeches (**C-**)

	Obama’08	C-	
“IT”	1	0	1
not “IT”	294,552	334,541	629,093
	294,553	334,541	629,094

$$Z \text{ score} = \frac{x - \mu}{\sigma} = \frac{1 - (294,553 \cdot 1/629,094)}{\sqrt{294,553 \cdot 1/629,094 \cdot (1 - 1/629,094)}} = 0.777$$

Characteristics Terms

- In our example, we have $Z \text{ score} = 0.777$

This value is not really an exception and thus the corresponding term (“IT” or “astronaut”) occurring only once cannot be qualify as “significant” for Obama 2008.

- We can consider another word type / subset.

	McCain'08	C-	
“Bush”	26	398	424
not “Bush”	154,339	474,331	628,670
	154,365	474,729	629,094

Characteristics Terms

- For the word “Bush” in McCain’s speeches in 2008 we compute the Z score as

$$Z \text{ score} = \frac{x - \mu}{\sigma} = \frac{26 - (154,365 \cdot (424/629,094))}{\sqrt{154,365 \cdot (424/629,094) \cdot (1 - (424/629,094))}} = -7.654$$

The resulting value is -7.654 (very small). The probability of having a Z score value lower than -2.33 is around 0.01.

Clearly the word “Bush” is underused in McCain’s speeches (in 2008) compared to the rest of the US corpus.

Other (Related) Questions

- Do we use all word types or remove some (not useful) types (e.g., “the”, “of”)?
- Do we use the surface (inflected) form or the lemma (e.g., “is”, “was” or “be”)?
- Do we apply a deeper morphological analysis to conflate related word types under the same stem (e.g., “American” and “America”)?
- Do we use only a subset of all possible POS tags (e.g., only nouns, adjectives, adverbs and verbs)?
- What is the difference between the frequency and the Z score?

Most Frequent Words

McCain 2008		Obama 2008	
Freq.	Word	Freq.	Word
2345	<i>I</i>	6203	<i>we</i>
2160	<i>we</i>	4216	<i>I</i>
1602	<i>our</i>	3276	<i>our</i>
1540	<i>will</i>	3164	<i>will</i>
821	<i>my</i>	2389	<i>you</i>
775	<i>you</i>	1566	<i>American</i>
775	<i>American</i>	1444	<i>they</i>
709	<i>they</i>	1313	<i>can</i>
640	<i>he</i>	1107	<i>America</i>
540	<i>country</i>	1081	<i>year</i>
530	<i>tax</i>	1047	<i>need</i>
485	<i>America</i>	958	<i>tax</i>

Most Significant Words

Z	McCain 2008	Z	Obama 2008
14.5	Obama	17.8	McCain
9.8	government	11.1	John
9.6	my	9.9	we
8.6	Canada	8.7	Bush
8.1	federal	7.7	jobs
7.9	among	7.5	Washington
7.8	small	7.4	up
7.7	judicial	7.3	relief
7.4	Arizona	7.2	working
7.4	court	7.1	why
7.3	very	7.1	street
7.1	such	7.0	family
7.0	business	7.0	because

Using Filter?

- We want to study the most significant bigrams (sequence of two words)
- Looking at the most frequent ones we obtain
 - of/IN the/DT
 - in/IN the/DT
 - i/PRP be/VB
 - to/TO the/DT
- Not really helpful
- Adding constraints?

Example of Filters

- We admit the following POS sequences

JJ NN white house

NN NN mortgage rate

- And for trigrams

NN NN NN stem cell research

JJ JJ NN next big idea

JJ NN NN clean energy economy

NN IN NN academy of science

- Difference between the frequency and the Z score (both with POS constraints)

Most Frequent Bigrams

	McCain 2008		Obama 2008
Freq.	Bigram	Freq.	Bigram
326	Senator Obama	479	<i>health care</i>
158	<i>health care</i>	384	Senator McCain
131	small business	322	<i>United States</i>
123	<i>United States</i>	300	<i>Wall Street</i>
111	<i>American people</i>	289	John McCain
48	<i>Wall Street</i>	284	<i>American people</i>
40	next street	245	<i>middle class</i>
40	new president	214	tax cut
38	tax increase	148	George Bush
35	health insurance	132	insurance company
35	government spending	131	tax break
34	<i>middle class</i>	129	new job

Most Significant Bigrams

Z	McCain 2008	Z	Obama 2008
28.5	Senator Obama	20.0	Senator McCain
8.4	small business	17.2	John McCain
8.1	government spending	13.9	Wall Street
6.7	tax increase	11.9	middle class
6.6	bad economy	11.4	tax cut
6.3	higher tax	11.0	Main Street
6.2	business tax	9.6	tax break
6.2	flex fuel	9.1	insurance company
6.1	law enforcement	8.5	George Bush
5.9	more job	8.4	more year
5.9	energy security	7.9	oil company
5.6	great country	7.6	rescue plan
5.6	tax rate	7.5	21st century

Most Frequent Trigrams

Freq.	McCain 2008	Freq.	Obama 2008
50	President I will	69	President United States
28	I elected President	67	President I will
25	you thank you	57	United States America
22	thank you thank	42	I running President
21	I believe we	40	we can afford
21	health care system	38	million new jobs
20	dependence foreign oil	35	we can choose
18	small business owner	34	we will make
17	I thank you	34	I President we
16	thank you I	33	President we will
16	I will work	33	I will make
15	I will make	32	will make sure
12	our country I	26	change we need

Most Significant Trigrams

Z	McCain 2008	Z	Obama 2008
5.0	hybrid flex fuel	8.2	State of America
4.6	nuclear power plant	5.6	common sense regulation
4.6	cost of energy	5.5	last eight years
4.5	strong have courage	5.3	middle class family
4.5	stronger better country	5.2	capital gain tax
4.5	selfishness in Washington	4.8	source of energy
4.5	mess of corruption	4.6	world class education
4.4	percent of American	4.6	month in Iraq
4.3	manufacture of hybrid	4.4	time for change
4.3	excess of Wall	4.2	jobs of tomorrow
4.0	worse keep tax	4.1	mountain of debt
4.0	tax increase spending	4.0	uncertainty for America
4.0	single government program	4.0	early childhood education

The Context of a Term

	Obama 2008
6	Washington we can
6	failure politician Washington
5	Washington player expect
5	status quo Washington
5	know happen Washington
5	dime Washington lobbyist
5	broken system Washington
4	Washington twenty six
4	Washington think long
4	Washington game Washington
4	they back Washington
4	politician Washington think
4	George Bush Washington

And for the President Obama?

Terms overused by the President

budget

Chrysler

department

recovery plan

new foundation

American recovery

reinvestment act

auto loan

higher education

health care reform

clean energy economy

thank

Turkey

secretary

recovery act

economic recovery

new investment

mutual interest

mutual respect

kind of energy

long term deficit

Other Association Measures

- We can resume all needed information into a contingency table (one per word / feature)
- A large corpus **C** is subdivided into two (disjoint) parts **S** and **C-** (with $\mathbf{C} = \mathbf{S} \cup \mathbf{C-}$)

	S	C-	
ω	a	b	$a + b$
not ω	c	d	$c + d$
	$a + c$	$b + d$	$n = a + b + c + d$

Mutual Information

- Basic Idea: Comparing two models (Church & Hanks, 1990)
- Under independence

$$Prob[S \cap \omega] = Prob[S] \cdot Prob[\omega] = \frac{a+c}{n} \cdot \frac{a+b}{n}$$

- Estimation (MLE)

$$Prob[S \cap \omega] = \frac{a}{n}$$

- How to measure the deviation between the two models?
- Mutual information (MI) for the word ω in the subset S

$$I(S; \omega) = \log_2 \left[\frac{Prob[S \cap \omega]}{Prob[S] \cdot Prob[\omega]} \right]$$

Mutual Information

$I(S;\omega) \approx 0$ Independence (random)

$I(S;\omega) > 0$ Positive association

$I(S;\omega) < 0$ Negative association

Example $IM(\text{"IT"}; \text{Obama'08}) = 1.09$

No clear decision rule

	Obama'08	US-	
"IT"	1	0	1
not "IT"	294 552	334 541	629 093
	294 553	334 541	629 094

Chi-square

$$\chi^2 = \sum_{i,j=0,1} \frac{(o_{ij} - e_{ij})^2}{e_{ij}}$$

Compute the statistics followings a chi-square distribution

Example word = “Bush”, S = McCain’08: $\chi^2 = 78.13$

Limit values: 6,63 $\alpha = 0,01$ (1 dof)
 10,83 $\alpha = 0,001$

	McCain’08	US-	
“Bush”	26	398	424
not “Bush”	154 339	474 331	628 670
	154 365	474 729	629 094

Conclusion

- Various methods have been proposed to define / weight the importance of each word / term in describing the semantic content of a document
- The Z score is relatively effective to discriminate between terms used by both speakers and terms overused by one of them
- Adding POS constraints is useful (but we need a POS tagger)
- Chi-square requires at least 5 observations in each cell
- Mutual Information (MI) does not have a clear decision rule
